USAF review completed.

25 YEAR RE-REVIEW

SECRET SCURE!

SECURITY INFORMATION

In this department, which Treiber supervised, projects Ior test stands for the engine group were the primary functions, but other Soviet development was also carried out. These included pressurized engine test cells and wind tunnels, and smaller items such as water brakes and various types of test stands. The assignments were, for the most part, difficult to accomplish both with respect to performance required and technical details such as noise dampers, energy recovery, and measurement accuracies. the personnel issuing these assignments had no concept of what equipment was necessary to test a turbojet engine unit.

(e)

25X1

25X1

(d) the engine group. There, working conditions were poorer than in the aircraft Of the German "specialists", only three at most had worked on the development of jet power plants. The other workers had a fair knowledge of general engineering but not in the specialized fields. The inheritance which the Soviets had received was completely worthless. For example, almost no data were found on the JUMO 012 project.

25X1

measurements of the Ol2 compressor were reproduced from scrap parts and that it was not known whether these parts, such as rotor blades and guide vanes, were from the latest developments or from earlier work. The whole enterprise bordered on technical swindle.

- Conscious of their weaknesses, the responsible directors and supervisors tried to change their activities to fields in which they were more familiar and proffered such projects to the Soviets. The Soviet management accepted these proposals, which were assigned to a group under the direction of Gerlach, but it also insisted on the development of jet power plants.
- (f) Besides the work on the JUMO 012, a new project called the JUMO 022 was started. this was strictly a postwar development. The compressor for the JUMO 012 had been constructed and was being tested using a steam turbine as a source of power at the time the transfer to the USSR took place in October 1946.

2. USSR (1946-50)

Contrary to their hopes, the "Peace Section", excluding certain of the lesser skilled personnel, was also transferred to the USSR. the engine group, 25X1 was shipped by train to Krasnaya-Glinka via Kuibyshev, and from there in automobiles to Uprawlentschsky, arriving 6 Nov 46. In this town, most of the personnel were assigned to apartments in various sections; the remainder, for whom apartments were not available, were primitively housed in a housing area on a hill on a bank of the Volga River. Later, those families received apartments in a settlement of wooden houses (called Finnish houses). A total

	SECURITY INFORMATION -3-	
	of 750 German specialists with their families lived in this town until September 1950. All of them had previously worked for Junkers/Dessau, BMW/Stassfurt, and Askania/Berlin.	25
)	The plant, officially named "State Research Plant #2", consisted of empty assembly shops, administration buildings, storehouses and auxiliary facilities arranged as sketched on Enclosure (A).	25)
	the shops of this plant, the dismantled equipment of the Junkers engine plant and of BMW/Stassfurt were set up. The construction departments were housed in Building #3. The Askania Group, with its workshops, was housed in a separate	
	area. The first task was the installation of the equipment and in designing, building and putting into operation the test stand (see Enclosure (B)). Because of the very poor living conditions, the attitude and morale of the Germans reached a dangerous stage. This was reflected in their lack of interest in their work and friction amongst themselves. Life was unbearable.	
	In early 1947, the Soviets circulated rumors that some of the specialists were to be returned to Germany. This seemed credible to the Germans because many departments were overstaffed and also because mistakes had been made in Germany in arresting people who were of no value to the Soviets. Because of this rumor, many were hopeful and refused to work, aiming to appear superfluous and thereby to be returned home.	
	At first this situation was tolerated by the Soviets be- cause no proper overall control of the plant existed. one person in each group regularly reported to NKVD officials	25
	concerning work efficiency, political attitude and discussions in general. The Soviets began arresting people who were evidently considered by them to be unreliable.	25
		-
		, s
	To minimize social hardships, german workers founded a social security agency and from	
	the funds of this agency all sick people received benefits. By this organization, the minimum living costs of our group were insured. Pensions were paid to widows and survivors of deceased specialists, who prior to my leaving the USSR, did not receive any support from the Soviet Union.

3. Results and Personalities

(a) One of the results of four years of research work in the USSR was the creation of the JUMO 021. This, with five thousand horsepower, represents remarkable progress for the Soviet Air Force — even if the fuel consumption figures do not attain the standards of British and American power plants of similar output. Furthermore, in these four years a working group evolved from a mixed group of engineers, which, with the experience gained in developing the JUMO 022, and in possession of all necessary theoretical working data, is now in position to develop within a year a modern unit ready for series production and considered satisfactory when evaluated by Western standards.

(b)	
. *	

- (c) The value of this research group to Soviet aircraft technique could only be judged if one knew the creative efficiency of native Soviet research work. As they did in Germany, the Soviets declared that in the USSR they already had something better and did not need German development. But the great interest of the Air Ministry was not only in the development of the JUMO 022, but also in secondary developments, such as the water brakes which were made there. Drawings of the water brakes had to be made for the Navy, but the Navy had to pay for them; this curious financial arrangement by the Soviets temporarily improved the poor economic conditions of the plant.
- (d) Col Kusnizoff, before his arrival at Kuibyshev, directed a Soviet research institute. Kusnizoff was a winner of the Stalin prize and a member of the Academy. He brought with him to Zavod #2 a small staff of collaborators who, according to their specialities, were distributed to various departments. For example, Kutscharoff worked in the compressor department. The Germans tried several times to discuss the previous working of this group, but received only careful and evasive answers.

	SECRET SECURITY INFORMATION
	·-6-
(e)	On 20 Apr 49, during a State Test Run, the transmission of the 022 broke and the whole propeller transmission 25% came loose. Only Deinhardt, and Kutscharoff were in the office when the accident became
	known. 25>
[it was even more surprising that the technical experts of the State Test Run Committee
	acknowledged the opinion of the German materials examination and had the State Test Run repeated.
(£)	Soviet workers had no responsible positions before September 1950 at Zavod #2 nor were they permitted to work independently either on test stands or in fabrication. It is 25) improbable that the research group there can exist without the German engineers. If all Germans were repatriated by the end of 1951, as the Soviets had declared, then bther research agencies must exist elsewhere in the USSR.
Orga	nization of the Junkers Group at Kuibyshev
(a)	Enclosure (C) shows the organization of the Germans and the leading personalities of each department. This structure was finally developed by trial and error. Oleschnowitsch was the first Soviet director of the plant, but was later replaced by Kusnizoff; this change had little effect on the plant's operation.
	The Soviet management had contact with the Soviet Air Ministry and there was also a permanent plant representative from that body. In addition, there were Communist Party and Labor Union offices at Zavod #2; each of these were actively connected with the operations of the plant.
(b)	Soviet Personalities
	(1) Oleschnowitsch: In Desgau he had been chief of the Sewist Office (25)
	In Dessau he had been chief of the Soviet Office:

Group who had traveled Their names, are as follows: 25X1 "Spiritual Moeller : Worked on control problems. leader" of Askania personnel. Chief of the Group Associate of Pfeiffer Dr Pfeiffer: Ornamuender: : Oscillograph Specialist Mueller. 5. Notes concerning fabrication possibilities of Zavod #2 Enclosure (A) is a sketch of the general layout of Zavod #2. This is not drawn to scale 25X1 In addition to those installations 25X1 shown, there was a social club building next to the plant's entrance. To the west of the social club was an area in which equipment brought from Germany was stored, packed in the original shipping crates; one item included in this packed equipment was the pressurized engine test cell from Junkers/Dessau. The whole plant area was surrounded by a wooden fence 2.5 to 4 meters high. Watchtowers were spaced along the fence and manned day and night; these watchtowers are the "Landmarks of Russia". The V-shaped building (Point No 4) to the south of the main shop housed the general administration offices on the upper floor and various other activities (barber shops, etc) on the lower. To the east were located the compressor building (Point No 5), carpentry and forge shops which contained annealing and hardening furnaces, two pneumatic hammers, and several "friction" presses of which only one was in operation. (c) All machinery had been brought from Junkers/Dessau and BMW/Stassfurt. 25X1 Because of tool limitations, parts had to be designed 25X1 as simply as possible from a fabrication standpoint. the process followed in machining a compressor rotor blade being as follows: The blanks are die-forged, 25X1 (d) rotor blade being as rollows: The blanks are die-rorged, milled on copy machines and finished by hand. The copy milling machine was made from an old lathe with the pattern running on one spindle and the blank on another. A feeler on the master blade determined the cut on the blank. Longitudinal movement of the miller was automatic. The milled blade was very rough and was finished by hand filing. A large percentage of blades were rejected. For each rejected blade the German responsible had 150 rubles deducted from his wages. This amounted to about 50 working hours' salary. Steel stator blades were made in the same manner. stator blades were made in the same manner.

(e) A special cutting tool was devised for forming the blade root slots in the turbine guide vane rings. This consisted of bronse electrodes having the same shape and size as the blade roots. These electrodes burned through the rings in an oil bath. The bronze were out very quickly and each electrode was good for only about five operations. They were milled from bar stock and finished by hand.

SECRET SECURITY INFORMATION -10-

(f) The limited facilities made the plant primarily a large machine shop. It had no large scale production possibilities with the equipment installed

In fact, the fabrication possibilities were so limited that the same blading was used in several stages of the compressor to cut down the complications of production.
